Here are some of the most used and important Photoshop tools: **Blur** The Blur command enables you to easily apply varying degrees of blur to an image using a Gradient Map or layer mask. **Burn** The Burn tool enables you to burn or eliminate areas of color in an image, and also can be used to create layers. It is especially handy for masking out areas of your image. **Color** The Color command enables you to remove or replace colors in your image. Depending on what parts of an image you want to change, you may prefer to use the Color Lasso tool instead of using the brush tool. **Curves** The Curves command makes adjusting the brightness and contrast in your image quick and easy. The Dodge tool enables you to quickly correct color cast, haze, and subject movement in your image. **Dynamics** The Dynamics command enables you to create and adjust motion effects, such as chromatic aberration. **Filters** The Filters command enables you to apply many different types of filters to your image. Filters can be used as layers or applied as a mask to create an overlay. You can apply an image filter by clicking the Filter menu (at the upper left corner of the image) and selecting Filters from the menu. You can also create effects by applying multiple layers of filters, such as a color overlay. **Foreground and background** The Foreground and Background commands enable you to cut out specific objects within your image. You can use these commands to remove objects, such as animals or people, from your images and then use them as the foreground layer to create new images. To

With the emergence of the compact digital camera, digital cameras are becoming smaller in size and have an increased number of functionalities, including, for example, image processing functions such as image compositing, image retouching, image processing, and image noise reduction. A digital camera usually includes a plurality of image processing functions. To execute the various functions, the camera is typically provided with a microprocessor for executing instructions, a memory connected to the microprocessor for storing the various instructions and data, and a graphics processing unit (GPU) or video processing circuit connected to the microprocessor for executing the various instructions and processing the data. However, the GPU is often not adequately fast for high speed image processing, particularly in executing graphics code. Thus, the design of the GPU may need to be modified to accommodate specific processes, such as graphics processing, required by the digital camera. Accordingly, there is a need to improve the efficiency of the GPU and thereby increase the speed at which the GPU executes instructions and processes data. on Planet 13 during the series' hiatus.
